

Monthly performance report

01 Jul 2018 - 31 Jul 2018

Comparison: 01 Jun 2018 - 30 Jun 2018 | Generated: 06 Oct 2026 23:54 IST

Mode: historical | Summary: gemini (gemini-3.5-flash-lite)

Performance at a glance

Metric	Current	Previous	Change
Purchased orders	6,292	6,167	+2.0%
Delivered orders	6,159	6,099	+1.0%
Delivered merchandise GMV	BRL 867,953.46	BRL 856,077.86	+1.4%
Delivered order AOV	BRL 140.92	BRL 140.36	+0.4%
Delivered payment total	BRL 1,027,903.86	BRL 1,012,090.68	+1.6%
Purchasing customers	6,230	6,128	+1.7%
Cancellation rate	0.7%	0.3%	+0.4 pp
On-time delivery rate	96.6%	98.8%	-2.2 pp
Average delivery days	8.96	9.24	-3.0%
Mean order review score	4.32	4.31	+0.3%

Money in BRL. GMV excludes freight and includes delivered item prices; it is not net revenue or profit. Rate changes are percentage points (pp); other changes are relative percentages. N/A means unavailable or a zero comparison denominator.

Executive summary

July 2018 Performance Summary: Growth in GMV and Orders Amid Slight Decline in On-Time Delivery

- Purchased orders increased by 2.0% from 6,167 to 6,292.
- Delivered merchandise GMV increased by 1.4% from BRL 856,077.86 to BRL 867,953.46.
- Cancellation rate increased by 0.4 pp from 0.3% to 0.7%.
- On-time delivery rate dropped by 2.2 pp from 98.8% to 96.6%.

Possible explanation

Hypothesis: Growth in purchasing customers and total delivered merchandise GMV may be driven by seasonal category demand increases such as watches_gifts and housewares, while operational bottlenecks contributed to the decrease in on-time delivery rates.

Recommended action

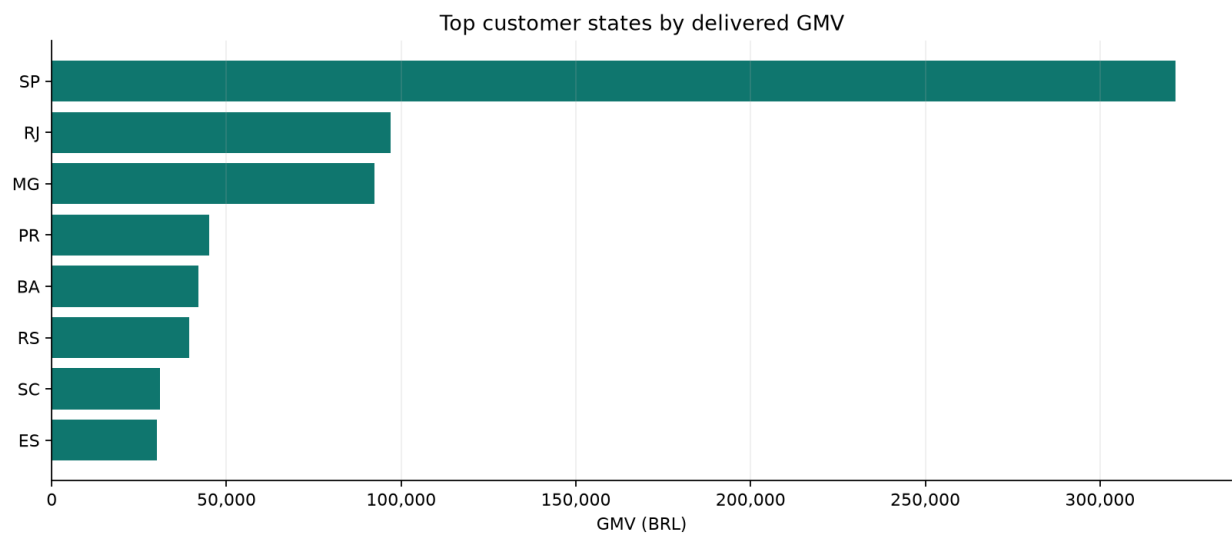

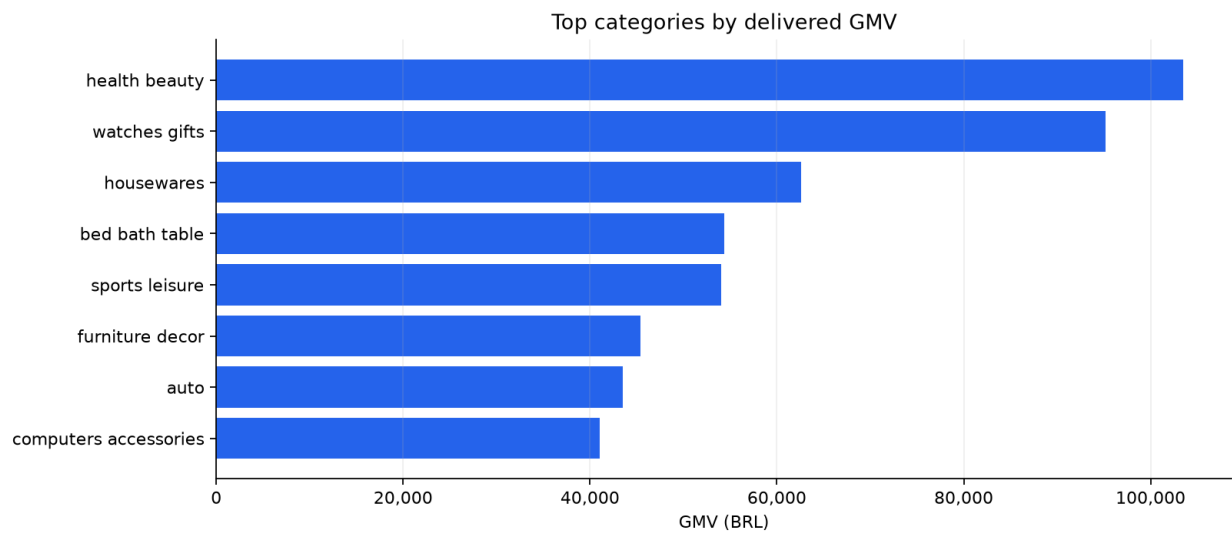

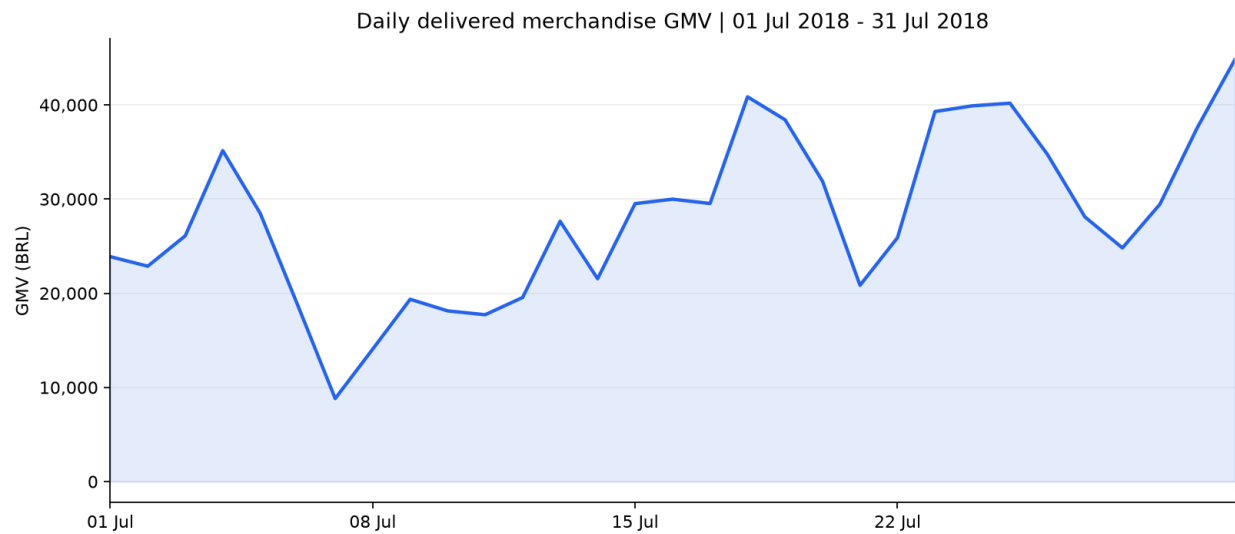

Investigate fulfillment bottlenecks in categories experiencing delivery delays to improve the on-time delivery rate back toward previous baseline levels.

Interpretation caveat

Figures are based on purchase-date cohorts with a final dataset snapshot and do not represent net revenue, profit, or causal proof.

Numeric evidence is authoritative; AI interpretation is not independently fact-checked.

Visual evidence

Methodology and quality

Purchase-date cohorts

Orders are assigned by their original purchase timestamp. Olist timestamps are treated as source-local naive timestamps; report generation uses Asia/Kolkata. Weekly windows are Monday-Sunday; monthly windows are calendar months. SQL uses inclusive start and exclusive end boundaries.

Metric definitions

Purchased orders and distinct customer_unique_id counts include all statuses. GMV and AOV use delivered orders only; $AOV = \text{delivered merchandise GMV} / \text{delivered orders}$. Payments sum payment_value on delivered orders and may differ from GMV because of freight and adjustments. Cancellation rate = canceled / purchased orders; unavailable is a separate status.

Delivery days average elapsed purchase-to-customer-delivery days across delivered orders with valid timestamps. On-time delivery compares delivery and estimated calendar dates, with missing estimates excluded. Review score is the mean of per-order average valid review scores on delivered orders, so multiple review rows do not overweight an order.

Coverage and sample sizes

Source purchase range: 2016-09-04 to 2018-10-17; 99,441 source orders.

Current period eligible orders: delivery: 6,156; on_time: 6,156; review: 6,121; payment: 6,159

Quality findings

- 6 delivered orders have missing/invalid delivery dates; excluded from delivery KPIs.

- Historical replay: statuses, payments and reviews reflect the final dataset snapshot, not what was known at the period end.

Read-only PostgreSQL snapshot; item/payment/review tables aggregated independently before joins. Aggregate CSVs, chart PNGs, evidence JSON and a checksum manifest accompany this PDF.
